Dear PG&E Hiring Team,

I am applying for the Operations Data Analyst role on the Reliability Strategy team. What stood out in your posting is how much of the job comes down to trust: the people deciding where reliability work goes need to count on the numbers in front of them. That is the part of data work I care about most. I enjoy the less visible steps behind it, like pulling data together, checking it, and building those checks into the process so they happen every time.

I have been simulating basketball seasons since I was eight, first with dice and paper and now in Python with 40 seasons of real stats. It taught me early to respect variance: a few good games do not make a trend, and neither do a few bad ones. My statistics and data science degree at UCLA gave me the tools to test that idea properly, and it shapes how I read any performance metric, including whether a change in reliability numbers is a real shift or just noise.

I work in Python, SQL, R, and Excel, and I like owning a task from the first question to the final presentation. I would welcome the chance to work with your engineering, operations, and strategy teams to understand what they need from the data and to deliver it clearly. Thank you for your time and consideration.

Sincerely,
Elijah Ang
