October 13, 2026

Dear 1Password Hiring Team,

I am applying for the Data Intern, Product Analytics role for Winter 2027. I recently graduated from UCLA with a B.S. in Statistics & Data Science (3.6 GPA), and I am drawn to the work of turning product behavior into clear recommendations that help teams make better decisions.

My coursework prepared me well for measurement and experimentation. Design and Analysis of Experiments covered randomization, blocking, ANOVA, multiple comparisons, and power and sample size, the foundation of A/B testing, while Causality, Linear Models, and Statistical Models and Data Mining gave me regression, logistic regression, and bootstrapping. At Data Detectives, I built automated Python pipelines that ingested, cleaned, and validated data from multiple sources, then trained and evaluated a random forest model on the results, so I understand why reliable data matters before any analysis begins.

I work in Python, R, and SQL, and I built interactive Tableau dashboards that let people browse and compare several years of City of Berkeley budget data on their own. My NBA Game Simulator began as a pen-and-paper dice game when I was eight and grew, over many years, into a Python pipeline built on 40 seasons of real data. That is how I like to work: curious, and willing to see a challenge through to completion. I have worked remotely, and I use AI tools to move faster while checking the results myself.

Thank you for your consideration. I would welcome the chance to discuss how I can contribute to the Product Analytics team.

Sincerely,
Elijah Ang
