Dear PG&E Hiring Team,

I am applying for the Operations Data Analyst, Reliability Strategy role (Req 172358). I recently graduated from UCLA with a B.S. in Statistics & Data Science (3.6 GPA), and three projects show how I work: find the problem, build the solution, and measure the impact.

At Minthril, I consult for a large manufacturing company whose production plans were time-consuming to process. I streamlined them with Excel pivot tables, VBA macros, and dashboards, cutting processing time by 90%. That is the kind of automated, efficient data process your posting describes.

During my Data Detectives internship, I started a Bay Area home price model that I continued afterward. Data from multiple sources had to be cleaned and validated before it could be trusted, so I built automated Python pipelines to ingest, clean, validate, and transform it. The resulting model, built on 9,000+ homes and 18 features, explains more than 87% of the variance in home prices in select Bay Area cities.

For the City of Berkeley budget data, the challenge was making over 47,000 rows readable. I condensed them into seven Tableau dashboards that let a general audience browse and compare spending, which taught me to present results clearly to non-technical readers.

Thank you for your consideration. I would welcome the chance to discuss how I can contribute to your team.

Sincerely,
Elijah Ang
